

A Grassy start

To compare one's journey through life as a sapling becoming a tree is very fitting. Digging deep and taking life as it comes gaining nutrients through soil sunlight and water. Enriching our lives with each passing day with our fair weather days and our disasters with our roots planted In time. But, we are not saplings Nor are we trees. We move from place to place, inhaling oxygen and exhaling carbon-dioxide. We also have to go out to meet others rather than waiting for them to meet us. But we do depend on nutrients coming from the soil, sun and water. So we should be patient like plants while remembering we are still human. We need interactions, we need nutrients and above all, we need each other.

Spark of Fame

Fame comes at a cost. A cost for everyone. The cost that your soul Will become washed away By a gimmick that people grab Without seeing the full package. The cost of being seen on everything That people eat, drink, wear, imagine, think, breath and in between. All it takes is that one spark To start an electrical want Across the universe. And time Only prolongs this absolute torture Since time only multiplies the madness. Time also adds annoyance among people Who want to move on. Time may have added salt To those not wanting that fame In the first place. It is more than Most can handle. But how can it be handled? The key is reflecting.

What do you stand for?
How do you see yourself?
Now is the time to be the best person you know you are.
Now is the time to accept your talents as a blessing and use them to their best.
Now is the time to be the god your fans and your maker know you are.
Now is the time to be the hero.
Now is the time to be you.

How to Handle your Dragons

I have a mighty dragon and so do you.
You may not believe this but it's true.
The dragon I have loves to fly with the clouds and snow It
loves to dance, sing and put on elaborate talent shows.
What does your dragon like? What does it need?
It may be an animal but its needs are like a seed.
It might require food, it might have a mouth to feed.
Or it gets its own food. If that's the case, take heed.
Never leave this dragon alone
To grapple, gimmick or groan,
Don't leave it like this, it will get bored.
Why else do myths show them with a hoard?
They're also quite smart With every single part
From their feet to brain and heart.
They will what you like and what you do not, They will
do this any temperature, cold or hot.
So what do you do in this case?
Well, the dragon makes a different case
But in either situation or case
Your reaction should be the same no matter the race.
Let them know you won't take nonsense one little bit,
It saves the both of you from going on a childish fit.
Treat them with respect like any person would anyway,
This is something that you should be doing every day.
Next, learn about your dragon and what it can do And
teach it about what you can too. Now set up some rules
for both ends
If you are still interested in being friend.
I'll let you do the rest if you've finished this guide, While
I saddle up with my dragon for a fun little ride.

Frosty Fairy Tale

Moonlight cascades to a young couple.
A soul of ice appeals to fun and knowledge.
The heart of fairies fiddles between the two.
Mimics of Sinatra and Monroe echo the night.
Thumbs twiddle within a giggle Eyes fly within
the ice of night Pixie wings fling in the mind.
Nonsensical smiles and giddy delight

And the waiter waits.

Waits the water that makes pitcher faces
Waits the napkins and silverware and waits
For a decision to be made.

Earth's Nature

We all depend on earth
To bring life in its ground,
Joined with the sun
To provide rain for essential Water for us to live.
We must be aware of this
That the earth is great And a force to be reckoned with.
Under the present crust
Lies forces that we must face.
Forces we have no dominance of.
These are the prices of our life with earth. Become
careless and face it. Face the wrath of retaliation
The strength we love to ignore,
Pass off as helpless or defenseless Thinking it is innocent
And we are helping a tiny baby.
But even babies know how to damage.
We affect the earth,
The earth affects us.
It is our omega and our foe.
Learn more to it than just the surface
